“AI Operating System handles AI-specific complexities.”

Synopsis

This course provides an in-depth understanding of operating systems, including their design, functions, and user interfaces. The course emphasizes solving problems in distributed and concurrent systems using computing theory and mathematics. Students will also learn to implement software solutions within system constraints and predict system behavior under random events using probability and expectation.

Course Learning Outcomes

CLO1 : Discuss the fundamental concept of operating systems (C2, PLO1).

CLO2 : Apply knowledge of computing theory and mathematics to solve problems in distributed and concurrent systems. (C3, PLO2).

CLO3 : Demonstrate a simple software solution and test its performance across various operating systems (OS) using VirtualBox (P5, PLO3).

Course Content Outline

Chapter 01 Introduction to Operating Systems
Chapter 02 Process Management and Scheduling
Chapter 03 Memory Management
Chapter 04 Process Synchronization
Chapter 05 File Management
Chapter 06 System Implementation and Constraints
Chapter 07 Operating System Security and Protection

"Current AI OS implementations rely on server deployment or specific hardware ecosystems."

Assessment

a) Continuous Assessment
   i. eTest (30%)
   ii. Assignment (30%)

b) Final Assessment
   iii. Practical Assessment (40%)
