BCC1313 – ALGORITHMS & COMPLEXITY

Lab 6

Instructions:

Write a program to perform the following operations on a Binary Search Tree (BST) implementation:

Requirements:

i) Insert an element into the tree.

ii) Delete an element from the tree.

iii) Search for an element in the tree.

iv) Find the Minimum element in the tree.

v) Find the Maximum element in the tree.

vi) Traverse the tree in in-order, pre-order, and post-order.

vii) Check if the tree is empty.

viii) Display the structure of the tree.

Sample output:

```
Binary Search Tree Operations:
1. Insert
2. Delete
3. Search
4. Find Minimum
5. Find Maximum
6. In-order Traversal
7. Pre-order Traversal
8. Post-order Traversal
9. Check if Tree is Empty
10. Display Tree
11. Exit
Enter your choice:
```
