

BCL1233/BIT1233/BTL1233 – SYSTEM ANALYSIS AND DESIGNS**ASSIGNMENT 3 (MARKING RUBRIC)**

Assessment Component	Excellent (80–100)	Good (60–79)	Satisfactory (40–59)	Weak (0–39)	Marks
Logic Modeling (40%)	Logic model is accurate, complete, and clearly represents the Hybrid Work Schedule Approval Process. All conditions, actions, and decision outcomes are correctly identified and logically structured. Appropriate modelling technique is selected and supported with clear explanations.	Logic model is mostly accurate and complete. Most conditions, actions, and decision outcomes are correctly identified with minor errors or omissions. Explanations are generally clear.	Logic model demonstrates a basic understanding of the process. Several conditions, actions, or decision outcomes are missing or inaccurate. Explanations lack clarity or detail.	Logic model is incomplete, inaccurate, or does not represent the selected process appropriately. Significant errors are evident, with limited or no explanation provided.	
Entity Relationship Diagram (ERD) (35%)	ERD is comprehensive, accurate, and consistent with the system requirements and process models. Entities, attributes, keys, relationships, and cardinalities are correctly identified and clearly presented.	ERD is mostly accurate and consistent. Most entities, attributes, keys, relationships, and cardinalities are correctly identified with minor errors.	ERD demonstrates a basic understanding of data modelling concepts. Several entities, attributes, relationships, or cardinalities are missing or inaccurate.	ERD is incomplete or contains major errors. Key entities, relationships, or attributes are incorrectly identified or omitted.	
Data Dictionary (15%)	Data dictionary is complete, accurate, and consistent with the ERD. All required elements are clearly defined, including attribute names, descriptions, data types, key types, and validation rules.	Data dictionary is mostly complete and consistent with the ERD. Minor inaccuracies or omissions are evident.	Data dictionary includes some required elements but lacks completeness, consistency, or clarity. Several entries are missing or inaccurate.	Data dictionary is incomplete, inconsistent with the ERD, or contains major inaccuracies. Limited information is provided.	
Model Validation and Integration (10%)	Discussion clearly demonstrates the relationships among the logic model, ERD, data dictionary, requirements, and process models. Ideas are well organised and supported with relevant examples.	Discussion demonstrates a good understanding of the relationships among the models with minor gaps in explanation or supporting details.	Discussion demonstrates a basic understanding of the relationships among the models but lacks clarity, depth, or supporting details.	Discussion is unclear, incomplete, or demonstrates limited understanding of the relationships among the models.
