

SYSTEM ANALYSIS AND DESIGNS

FINAL PROJECT (MARKING RUBRIC)

Assessment Component	Excellent (80–100)	Good (60–79)	Satisfactory (40–59)	Weak (0–39)	Marks
User Interface Design (30%)	Wireframes are clear, well-organised, and fully aligned with the system requirements and selected business processes. Screen layouts, navigation elements, input fields, action buttons, and messages are complete, consistent, and user-friendly. Explanations are clear and relevant.	Wireframes are generally clear and aligned with the system requirements. Most interface elements are included with minor omissions or inconsistencies. Explanations are adequate.	Wireframes demonstrate a basic understanding of interface design. Several interface elements are missing, unclear, or inconsistent with the requirements. Explanations lack detail.	Wireframes are incomplete, poorly organised, or inconsistent with the system requirements. Significant interface elements are missing or inaccurate. Limited or no explanation is provided.	
UML Modelling (20%)	UML diagrams are accurate, complete, and fully consistent with the requirements, process models, and logic models. The relationships, interactions, and workflows are correctly represented using appropriate UML notation. Explanations clearly justify the design decisions.	UML diagrams are mostly accurate and consistent with previous models. Minor errors or omissions are present in notation, relationships, or workflows. Explanations are generally clear.	UML diagrams demonstrate a basic understanding of modelling concepts but contain several errors, omissions, or inconsistencies. Explanations are limited or unclear.	UML diagrams are incomplete, inaccurate, or inconsistent with previous models. Significant errors in notation and relationships are evident. Limited or no explanation is provided.	
Test Case Design (30%)	Test cases are complete, relevant, and clearly documented. Test objectives, input data, expected results, and actual results are accurate and comprehensive. Both valid and invalid scenarios are included with appropriate coverage of the selected function.	Test cases are mostly complete and relevant. Most required elements are included with minor errors or omissions. Test coverage is adequate.	Test cases demonstrate a basic understanding of testing concepts. Several required elements are missing or unclear. Test coverage is limited.	Test cases are incomplete, inaccurate, or poorly documented. Significant information is missing, and test coverage is insufficient.	
Traceability and Reflection (20%)	Traceability matrix clearly demonstrates the relationships among requirements, process models, business rules, data models, and UML diagrams. Reflection provides insightful discussion of challenges, consistency strategies, and key lessons learned.	Traceability matrix demonstrates most relationships among project artefacts with minor gaps. Reflection discusses challenges and lessons learned with adequate detail.	Traceability matrix demonstrates limited relationships among project artefacts. Reflection provides basic discussion with limited detail or clarity.	Traceability matrix is incomplete or inaccurate. Reflection demonstrates limited understanding of the analysis and design process.
